The LAR/PTP delta/PTP sigma subfamily of transmembrane protein-
tyrosine-phosphatases: multiple human LAR, PTP delta, and PTP sigma tyrosine-phosphatases: multiple human LAR, PTP delta, and PTP sigma isoforms are expressed in a tissue-specific manner and associate with the LAR-interacting protein LIP-1.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=92119637; PubMed=1370651;

Natl. Acad. Sci. U.S.A. 91:4477-7481(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tyrosine + phosphate.
-!- SIMILARITY: Contains 1 FERM domain.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens (Human).

Note I.—M., Burghes A.H.M., Rotter A.;
Fibroblast growth factor (FGF-1) transcripts delineate a rostrocaudal
boundary in the granule cell layer of the murine cerebellar cortex.";
J. Comp. Neurol. 391:444-45[1998].
J. FUNCTION: May be involved in both signal transduction and cellular
adhesion in the CNS. May have specific signaling roles in the
tyrosine phosphorylation/dephosphorylation pathway in the anterior
compartment of the adult cerebellar cortex.

--- CATALITIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isoid=Q99M80-5; Sequence=VSP_007803, VSP_007805; TISSUS SPECIFICITY: Expression is restricted to the CNS.
Distributed throughout the brain and spinal cord.
DEVELOPMENTAL STAGE: Exceptionally high levels found in the cortex and olfactory bulbs during perinatal development and are downergulated during postnatal week 2. Expression in the cereballar cortex is restricted to the granule cell layer of lobules 1-6 Anterior and posterior compartments become discernible only during postnatal weeks 2 and 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -:- SIMILARITY: Contains 1 MAM domain.
-:- SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
-:- SIMILARITY: Contains 4 ibronectin type III domains.
-:- SIMILARITY: Contains 2 protein-tyrosine phosphatase domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isold=Q99M80-2; Sequence=VSP_007803, VSP_007806; Name=3; Synonyms=RPPrho2; Isold=Q99M80-3; Sequence=VSP_007803, VSP_007804; Name=4; Synonyms=RPPrho1; Isold=Q99M80-4; Sequence=VSP_007803;

New nucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SLD, PTP05, PTP10, ALP and ALK7 proteins. The present sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTP8) and are used to identify

substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/thronine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The presents enquence represents mouse PTP05. The above proteins, other than SLK-7, are protein tyrosine phosphatases (PTP9) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to identify prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polymuclectides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes isolated, enriched or purified nucleic acids encoding PrD04, SAD, PTD55, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTD65. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTP8) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and tympoly that involve the proteins of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzhaimer's Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgenic animals and in gene thereby
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 VFLLIKTIWYNVFKLWKGKLIFGNKONSENVKPSHHLSFSDKYELVYPEPLESDTDETVW 120

The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (KPP). KPP agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant expression of KPP, particularly cell profiferative disorders (e.g. arteriosclerosis, abherosclerosis, cirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycythaemia vera, psoniasis, primary thromobocytopaemia or ancel, developmental disorders (e.g. acidosis, anaemia or mencal retardation), neurological disorders (e.g. Alzheimer's disease, parkinson's disease or epilepsy), autoimmune, inflammatory disorders (e.g. Alzheimer's disease, parkinson's disease or epilepsy), autoimmune, allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, infabble bowel syndrome, multiple sclerosis, osteoarthitis, osteoarthitis, osteoarthitis, signers syndrome, rheumatoid arthritis, Sigoren's syndrome, uveitis), or viral, bacterial, fungal, parasliki, protozoan or helminthic infections. The KPP is useful in assessing the effects of exogenous compounds on the useful in gene therapy and for creating transgenic animals to model human cyresion of nucleic acids and kinases and phosphatases. KPP gene is useful in gene therapy and for creating transgenic animals to model human
(e.g. AIDS, allergy or anemia), multiple sclerosis, osteoarthritis,
cancer or hepatitis.
                                                                                                  Claim 1; Page 243-244; 282pp; English.

Human; protein phosphatase; PP-4; immune system disorder; AIDS; allergy; neurological disorder; developmental disorder; Alzheimer's disease;

The present sequence is human protein phosphatase (PP)-4. PP
polymucleotide and polypeptide are useful in the diagnosis, treatment and
presention of immune system disorders. meurological disorders. Examples of
immune system disorders and cell proliferative disorders. Examples of
immune system disorders include acquired immune deficiency syndrome
(AIDS), severe combinated immunodeficiency disorders syndrome,
captratory distress syndrome, altergies, amyloidosis, anaemia, asthma,
trespiratory distress syndrome, atopic dermatitis, diabetes mellitus,
atherosclerosis, Crohn's disease, atopic dermatitis, diabetes mellitus,
cmphysema, Goodpasture's syndrome, good, Graves' disease, multiple
solerosis, myasthenia gravis, myocardial or pericardial inflammation,
osteoarthritis, osteoporosis pancreatitis, psoriasis, Reiter's syndrome,
colerosis, traums, neurological disorders include Alzheimer's disease,
thutington's disease, dementia, epilepsy, Parkinson's disease,
muntington's disease, dementia, epilepsy, Parkinson's disease,
tuntington's disease, dementia, epilepsy, parkinson's disease,
tretardation and other developmental disorders, seasonal
disorders including mood, anxiety, and schizophrenic disorders, seasonal
effective disorders include e.g. renal tubular acidosis, Duchanne and
Becker muscular dystrophy, gonadal dysgenesis, hypothyroidism; cell
corrections, bursitis, cirrhosis, hepatitis, psoriasis and cancer
including adenocarcinoma, leukaemia. The polypeptide and polymolectide
are further useful for analysing proteome of a Lissue or a cell type,
creening an agonist/anaegonist, a compound that specifically binds to it to the polymucleotide is u Au-Young J, Baughn MR, Ding L, Elliott VS, Gandhi AR, Griffin JA; Hafalia A, Kearney L, Lee EA, Lu Y, Nguyen DB, Patterson C; Ramkumar J, Reddy R, Sanjanwala MS, Stewart EA, Tang YT, Thornton M; Tribouley CM, Walia NK, Yang J, Yao MG, Yue H; Novel polypeptide, useful for diagnosing, treating or preventing disorders of growth and development, immune system, neurological and cell proliferation diseases, comprises cancer protein phosphatase cell proliferative disorder, Huntington's disease, arteriosclerosis, renal tubular acidosis, gonadal dysgenesis, cancer; adenocarcinoma; leukaemia, transgenic animal, gene therapy. /note= "Tyrosine specific protein phosphatase active /note= "Protein-tyrogine phosphatase" 340. .388 /label= Transmembrane_domain /note= "Tyr_phosphatase" 362. .379 Claim 1; Page 105-106; 116pp; English.                                                                                                                                              New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               381
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   441
                                                                                                                                                                                                                                                              The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

The present invention relates to a new human tyrosine phosphatase

colypeptide. The invention is useful for the preparation of a medicament
condulating the activity of human tyrosine phosphatase in a disease
such as obesity, diabetes, a central nervous system (CNS) disorder,
chronic obstructive pulmonary disease, cardiovascular disorder or cancer.

The invention is useful for treating a human tyrosine phosphatase
invention is useful for treating the above mentioned diseases. The
invention is useful for treating the above mentioned diseases. The
invention is useful for treating the above mentioned diseases. The
consideration is selected from Parkinson's disease, and the
correct Alzheimer's disease, and Huntington's disease, and the
cardiovascular diseorder is selected from congestive heart failure and
myceardial infarction. The molecules of the invention are useful in
any cardiovascular disease and abnormalities of the presence of
musceptibility to disease and abnormalities related to the presence of
mutations in the polynucleotide coding the polymeptide of the invention.
The present amino acid sequence represents the human tyrosine phosphatase
protein #1 of the invention. This sequence is encoded by the human
tyrosine phosphatase gene located on chromosome 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      219 YIRIVNHBBEYFYIATQGPLPETIEDFWQMVLENNCNVIAMITREIECGVIKCYSYWPIS 278

New nucleic acids encoding cancer associated phosphatases, useful as targets for screening pharmaceutical agents that inhibit the growth of tumor cells, or for diagnosing and treating cancer, inflammation or autoimmune disease.

(KINE-) KINETEK PHARM INC.

WPI; 2003-902934/82. N-PSDB; ADD89794.

Delaney AD;

Claim 1; SEQ ID NO 10; 63pp; English.

The present invention describes an isolated cancer associated phosphatase nucleic acid. Also described: (1) a method of screening for biologically active agents that modulate a cancer associated phosphatase function; (2) a method for the diagnosis of cancer; (3) a method for inhibiting the carcier deposphatase, where the targets are associated with signal transduction in cancer cells; (5) a compound (C) for the treatment of a cancer cumour; (6) a composition for the treatment of a tumour comprising a pharmaceutical carrier and (C); (7) methods for treating a tumour of (8) a method for visualising a tumour in a patient. A cancer associated phosphatase of the present invention has cytostatic, immunosuppressive, antidiabetic, neuroprotective, antidinflammatory, vulnerary, contipaoriatic, antiarteriosclerotic, antidiathatic; antidiateriosclerotic, antidiathatic; antidiateriosclerotic, antidiathatic; contingoriatic, antidiateriosclerotic, antidiateriosclerotic, antidiated and antianglogenic activities. The cancer associated phosphatases and mucleic acids encoding the proteins are useful for cystalising tumours in patients or diapensing and treating cancer, e.g. cystalising tumours in patients or diabetes mellitus, multiple sclerosis, chemmatoid arthritis, psoriasis, atherosclerosis, inflammation, scarring, chemmatoid arthritis, psoriasis, atherosclerosis, inflammation, scarring, chemmatoid arthritis, psoriasis, ars targets for screening pharmaceutical equence represents the human cancer associated phosphatase

CC determining patient prognosis, arstepts for screening pharmaceutical equence represents the human cancer associated phosphatase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            219 YIRIVNHEEEYFYIATQGPLPETIEDFWQMVLENNCNVIAMITREIECGVIKCYSYWPIS 278
                                                                                                  The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 279 IKBPLEFEHFSVFLETFHVTQYFTVRVFQIVKKSTGKSGCVKHLQFTKWPDHGTPASADF 338

```
The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recarcion (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences. ABG00010-ABG30377 represent novel human diagnostic gatent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the lectronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

```

The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (KPP). KPP agonists and antagonists are useful for diagnosing, traating or preventing disorders associated with aberrant expression of KPP, particularly cell prodiferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, paroxysmal nocturnal haemoglobiumria, polycythaemia vera, psoriasis, primary thromobocytopaemia or mental retardation), neurological gisorders (e.g. Alzhiener's disease, parkinson's disease, acidosis, anaemia or mental retardation), neurological disorders (e.g. Alzhiener's disease, parkinson's diseases or epilepsy), autoimmune, inflammatory disorders (e.g. Alzhiener's disease, parkinson's diseases or applessy), autoimmune, allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's disease, disabimoto's thyroiditis, irritable bowel syndrome, gout, Grave's disease, Hashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis, osteoarthritis, osteoporosis, pancreatitis, Reiter's syndrome, rheumatoid arthritis, Sjogram's syndrome, uveitis), or viral bacterial, fungal, parastitic, processon or halminthic infections. The KP is useful in assessing the effects of exogenous compounds on the cxpression of nucleic acids and kinases and phosphatases. KPP gene is useful in gene therapy and for creating transgenic animals to model human disease. The present sequence is human KPP protein

                                                                                                                                                                                                            The specification describes human protein kinase/protein phosphatases. It is expected that the protein kinase/protein phosphatase gene participates in signal transduction in cells. The protein kinase/protein phosphatase polypeptides and polymucleorides are useful for developing diagnostics and treatment agents for human and animal diseases. The protein kinase/protein phosphatase polypeptides are useful as target molecules in designing novel drugs. The protein kinase/protein phosphatase polypeptides are useful as target molecules in polymucleorides are useful as a source of probes and primers, which may be used to isolate homologous sequences. The present sequence represents a human protein, which is used in the course of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes human protein kinase/protein phosphatases. The polypeptides are expected to participate in signal transduction in cells. The kinase phosphatases are connected with intracellular signalling pathways. Antisense oligonuclectides and compounds identified by screening (agonists or antagonists) can be used to treat human or animal disorders associated with the expression or function of the protein. In addition, the polypeptides may be used as target molecules fir drug development. The present sequence represents a polypeptide, used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               123 ETSVSEKELTQLAQIRPLIFNSSARSAMRDCLNTLQ-----KKEBLDIIREFLELEQMT 176

The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a past 2-hybrid selection to isolate prey proteins encoded by performing a past 2-hybrid selection to isolate prey proteins and then compercial interacting domains) proteins. Also included are a complex in selecting a polypeptide in the adipocyte cells, a combinant host cell expressing at least one of the interacting colypeptides on the complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a SID (RTM) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a comprising the SID (RTM) polynucleotide, a recombinant host cell comprising the vector, a protein chip comprising the polypeptides are of comprising the vector, a protein chip comprising the polypeptides of including its fragment or variant). The complex, polypeptides, a polymucleotides and compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is comprising the therapeutic effect. The present sequence represents a SID (RTM) for screening drugs that modulate the protein interaction, thus exhibiting the therapeutic effect. The present sequence represents a SID (RTM) by the sequence of the invention of the invention wew complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A cDNA library was prepd. from human glioma cell line U-343 MGa 31L or AG1518 human foreskin fibroblasts. Degenerate primers based on conserved regions of PTPs were prepd. Sense oligow were AAQ85926 and AAQ85927, and the antisense oligo was AAQ85928. Three clones defined novel PTP sequences. Two of these were named PTPL1 and GLM-2. The U-343 MGa 31L cDNA library was screened with labeled probes corresp. to PTLP1. The AG1518 human fibroblast cDNA library was also screened. The complete ORF of PTPL1 was derived from six overlapping cDNA clones and is given in AAQ85924. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   6 KVRGKTGRDNDEEEGNSGNLNLRNSLP---SSSQKMTPTKPIFGNKMNSENVKPSHHLSF 62
